Partial Healing model

Theory

[A.C. Pronk 2001]

Total dissipated energy W_{tot} is composed of:

- System loss W_{syst} can be ignored for good equipment
- Fatigue consumption W_{fat} decrease the stiffness and increase the phase angle $W_{fat} = \delta \cdot W_{dis}$
- Visco-elastic loss W_{dis} transformed into heat $W_{dis} = \pi \cdot \varepsilon \cdot \sigma \cdot \sin \phi$

Partial Healing model

Functions in strain controlled mode

Stiffness damage part Q \longrightarrow $W_{fat} = \delta \cdot W_{dis} = \delta \cdot \pi \cdot \varepsilon \cdot \sigma \cdot \sin \phi = \delta \cdot \pi \cdot \varepsilon_0^2 \cdot S \cdot \sin \phi$

$$\frac{d}{dt} Q = \frac{d}{dt} \delta \cdot W_{dis} \approx \delta \frac{\Delta W_{dis}}{\Delta t} = \delta \cdot f \cdot \pi \cdot \varepsilon_0^2 \cdot S \cdot \sin \phi$$

Describe the evolution of the loss and storage stiffness modulus during the fatigue test for a unit volume

Loss modulus $F\{t\} = S \cdot \sin \phi = F_0 - \int_0^t \frac{dQ\{\tau\}}{d\tau} \left[\alpha_1 e^{-\beta(t-\tau)} + \gamma_1 \right] \cdot d\tau$

Storage modulus $G\{t\} = S \cdot \cos \phi = G_0 - \int_0^t \frac{dQ\{\tau\}}{d\tau} \left[\alpha_2 e^{-\beta(t-\tau)} + \gamma_2 \right] \cdot d\tau$

recoverable damage unrecoverable damage

Partial Healing model

Solutions for UT/C fatigue test

Loss modulus $F\{t\} = S \cdot \sin \phi = F_0 e^{-Bt} [Cosh\{Ct\} + D Sinh\{Ct\}]$

Storage modulus $G\{t\} = G_0 - F_0 \left[\frac{\alpha_2}{C} e^{-Bt} \cdot Sinh\{Ct\} + \frac{\gamma_2}{\gamma_1} (1 - e^{-Bt} \cdot [Cosh\{Ct\} + E Sinh\{Ct\}]) \right]$

Model parameters: $F_0, G_0, \alpha_1, \alpha_2, \beta^*, \gamma_1, \gamma_2$

Road and Railway Engineering

TU Delft

Conclusions

- PH model provides a good prediction for the evolution of complex stiffness modulus and phase angle in the **uniaxial tension and compression test (UT/C test)**.
- The model parameter Y_1 and Y_2 can be used to determine the range of endurance limit, and this range does not change significantly with the increase of the specimen size. But more tests are needed to validate this.
- N_{PH} and N_R are close to each other compared to the traditional fatigue life $N_{f,50}$
- The fatigue life obtained from the **UT/C fatigue** test is independent of the specimen size.

Road and Railway Engineering

 TU Delft

Study in the future

- ✓ Validate of the endurance limit $\varepsilon_{\text{limit}}$ predicted by the PH model
- ✓ Based on the UT/C test results, apply the PH model to the inhomogeneous fatigue tests, e.g. **4-point bending**, **2-point bending fatigue** tests, etc.
- ✓ Investigate the influence of temperature, loading mode.
